Foams, soap films and minimization

Simon Cox

Consider a bubble...

The force of surface tension causes
the *area of the film to be
minimized.*

The least area way to
enclose a given volume is a
sphere.

"BUBBLES."

By Sir James Mordaunt, Bt., P.R.A.
After the Original in the possession of Messrs. PEARS

Catenoids

What is the shape of the surface joining two circular rings?

This “catenoid” shape has the least surface area!

foams@aber.ac.uk

Plateau's Equilibrium Rules

How do two bubbles meet?

Minimization of area gives geometrical constraints:

- three films meet in a line at 120°
- four lines meet at a point at 109°

Wire Frames

Plateau used wire frames to observe and formulate his laws. A simple example is the triangular prism, which has two possible (non-trivial) soap film combinations that touch all edges:

Wire Frames

Each film is flat (planar), but the lines where they meet may not be straight.

Steiner problem

Soap films solve the Steiner problem:

Given n cities on a plain (ignoring rivers etc.), what is the arrangement of roads joining them with minimum length?

Geometrical proofs long-winded and complex;
experimental demonstration straightforward

foams@aber.ac.uk

Steiner problem

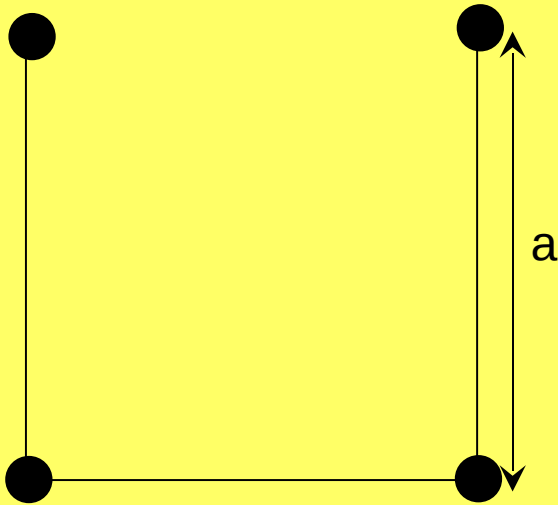

Take three cities at the corners of an equilateral triangle of side-length a .

What is the arrangement of roads connecting them that minimizes the total length of road?

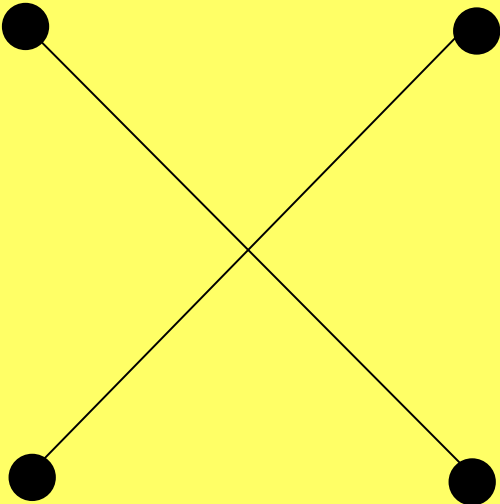

Steiner problem

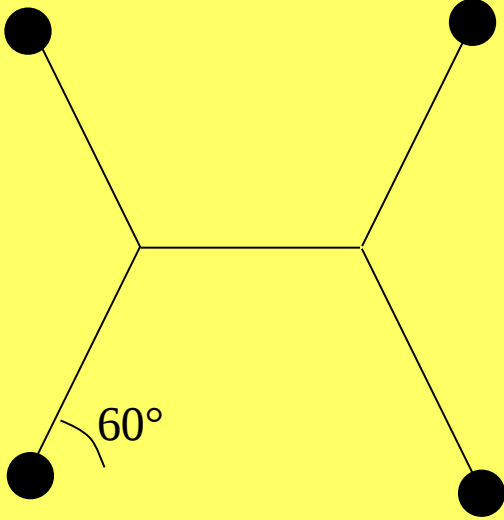

Four cities at the corners of a square of side a :

$$L = 3a$$

$$L = 2\sqrt{2}a \approx 2.83a$$

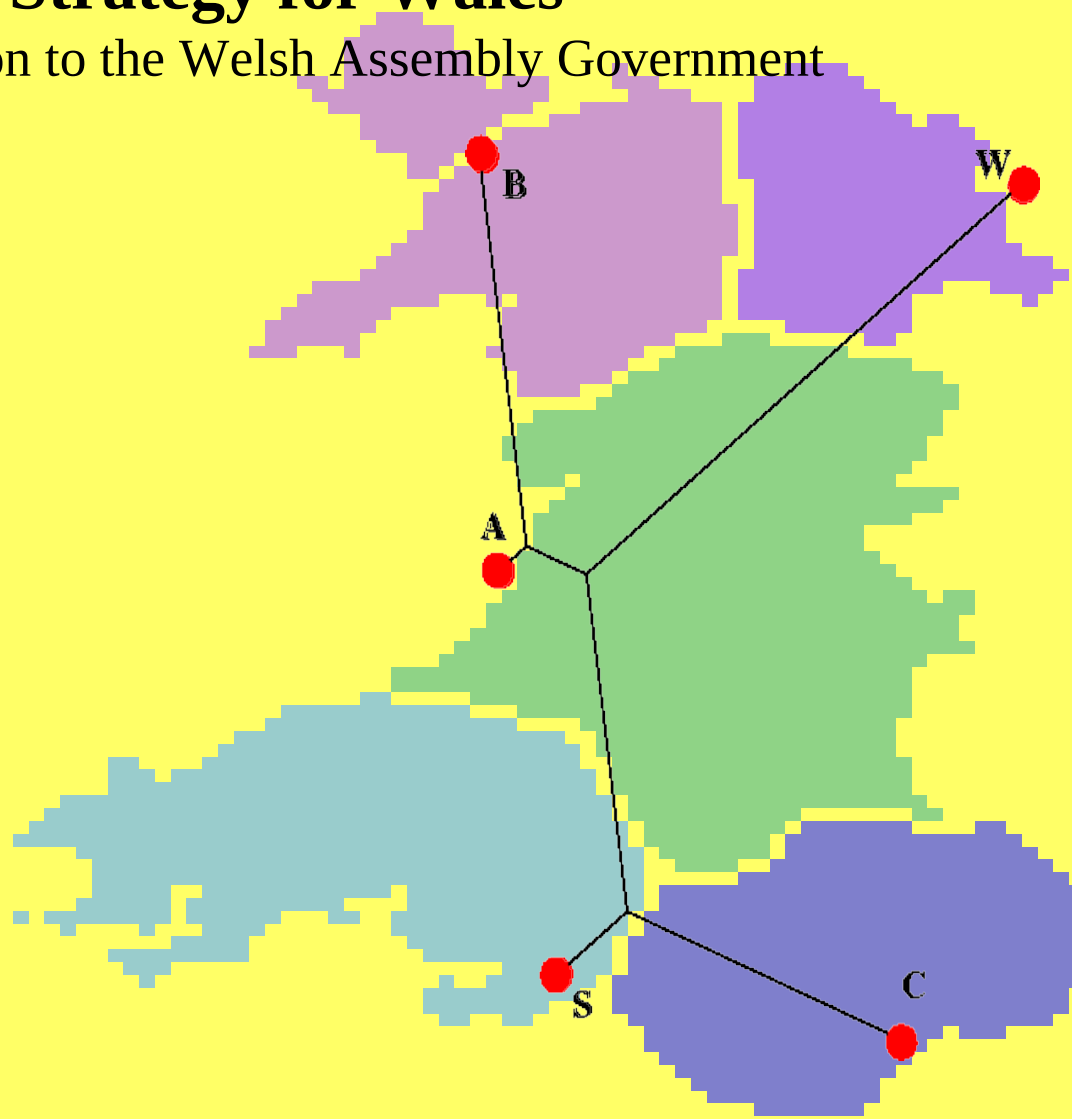

$$L = (1+\sqrt{3})a \approx 2.73a.$$

A Transport Strategy for Wales

A recommendation to the Welsh Assembly Government

Use Surface Evolver software to find which is the lowest minimum

Why are foams of interest?

Many applications of industrial and domestic importance:

- Oil recovery
- Car manufacture
- (Industrial) cleaning
- Fire-fighting
- Ore separation
- Personal Care
- Food products
